COMS W4111-003/V003 (Fall 2022) Introduction to Databases

Homework 4: Both Tracks

Lili Tan

Setup Environment

MySQL

```
In [1]:
          %load ext sql
In [2]:
          import pymysql
In [3]:
          %sql mysql+pymysql://root:dbuserbdbuser@localhost
In [4]:
          # Note that your list of databases will be different.
          %sql show databases;
          * mysql+pymysql://root:***@localhost
         12 rows affected.
Out[4]:
                  Database
               classicmodels
                  COMS4111
                f22_hw1_got
           f22_hw1_got_clean
                   f22_hw2
                f22_midterm
          information_schema
           lahmansbaseballdb
                      mysql
         performance_schema
              w4111_f22_hw4
```

Neo4j

- This section assume that you have set up Neo4j on Aura DB, installed the Movie database and that your interest is running. If you do not use your instance for a while, Aura suspends it. You will have to login and restart it.
- Since these are cloud databases, I put my credentials in a file instead of a notebook that I share with everyone and place on GitHub. You will have to set the correct information for your instances.

```
In [5]:
          #import sys
          #sys.path.append('/Users/donaldferguson/Dropbox/00NewProjects/F22-W4111-HW4')
 In [6]:
          #import my_secrets
          • You may have to install py2neo using pip or Conda.
 In [7]:
          # !pip install py2neo
 In [8]:
          from py2neo import Graph
 In [9]:
          aura_url = "neo4j+s://d4736a05.databases.neo4j.io"
          aura_user = "neo4j"
          aura_pw = "KCvzV_oo2gWXDp1AfdRKBqThznmEwY5McMesMrQ6y3c"
In [10]:
          def t1():
              graph = Graph(aura url, auth=(aura user, aura pw))
              q = "match (r:Person) where r.name='Tom Hanks' return r"
              res = graph.run(q)
              for r in res:
                  print(r)
In [11]:
          t1()
         Node('Person', born=1956, name='Tom Hanks')
```

MongoDB

- This section assume that you have set up MongoDB on Atlas.
- You need to follow instructions to enable connecting from a remote Python application.
- You also need to pip/Conda install pymongo.
- You will have to your URL for connecting.

```
Databases = [{'name': 'testdb', 'sizeOnDisk': 73728, 'empty': False}, {'name': 'admin', 'sizeOnDisk': 344064, 'empty': False}, {'name': 'local', 'sizeOnDisk': 6465396736, 'empty': False}]
```

• The following will do some additional testing.

```
In [16]:
          client = pymongo.MongoClient(
                   "mongodb+srv://lily:dbuserdbuser@cluster0.q3j5jvq.mongodb.net/?retryWrites=true&w=majorit
In [17]:
          client["testdb"]["testcollection"].insert_one(
                   "class": "W4111",
                   "is_cool": True
          <pymongo.results.InsertOneResult at 0x7f8085194bb0>
In [18]:
          client["testdb"]["testcollection"].insert_one(
                   "professor": "Ferguson",
                   "is_cool": "Seriously? Are you kidding me? Heck NO!"
          )
          <pymongo.results.InsertOneResult at 0x7f80847bdcd0>
Out[18]:
In [19]:
          res = client["testdb"]["testcollection"].find()
In [20]:
          some_info = list(res)
          some_info
Out[20]: [{'_id': ObjectId('63976f0b52e0d148e0db50d5'),
            'class': 'W4111',
            'is_cool': True},
           {'_id': ObjectId('63976f0b52e0d148e0db50d6'),
            professor': 'Ferguson',
            'is_cool': 'Seriously? Are you kidding me? Heck NO!'}]
```

Common Tasks for Both Tracks

Load MongoDB Atlas

- The project contains two files: data/characters.json and data/episodes.json.
- The following code snippets will load the information into lists. This is a little tricky because we need to extract the embedded array from the JSON object.

- You now have two lists in the notebook. Save the documents in the array to Atlas using databases name hw4. You must write Python code using pymongo to load the data.
- Put your code in the cells below and execute it.

```
In [27]: #insert characters
for i in range(len(characters)):
        client["hw4"]["characters"].insert_one(characters[i])

#insert episodes
for i in range(len(episodes)):
        client["hw4"]["episodes"].insert_one(episodes[i])
```

• The following code will test that you have loaded the information.

```
In [28]:
          ep = client['hw4']['episodes'].find_one(
               {"seasonNum": 1, "episodeNum": 1}
In [29]:
Out[29]: {'_id': ObjectId('63976f1352e0d148e0db525c'),
            seasonNum': 1,
           'episodeNum': 1,
           'episodeTitle': 'Winter Is Coming',
           'episodeLink': '/title/tt1480055/',
           'episodeAirDate': '2011-04-17',
           'episodeDescription': "Jon Arryn, the Hand of the King, is dead. King Robert Baratheon plans to
         ask his oldest friend, Eddard Stark, to take Jon's place. Across the sea, Viserys Targaryen plans
          to wed his sister to a nomadic warlord in exchange for an army.",
           openingSequenceLocations': ["King's Landing",
            'Winterfell',
            'The Wall',
            'Pentos'],
           'scenes': [{'sceneStart': '0:00:40',

```

Load MySQL

- The data directory contains 5 CSV files:
 - got cast.csv
 - got_cast_details.csv
 - got_episodes.csv
 - got title ratings.csv
 - got_title_cast.csv
- Create a MySQL databases w4111_f22_hw4 and load the CSV files. You should use Pandas to load and save the information.

Put your code in the cells below and execute it.

```
In [32]:
          %%sql
          DROP database IF exists w4111_f22_hw4;
          CREATE database w4111_f22_hw4;
           * mysql+pymysql://root:***@localhost
          5 rows affected.
          1 rows affected.
Out[32]:
In [33]:
          import pandas as pd
          from sqlalchemy import create_engine
          engine = create engine("mysql+pymysql://root:dbuserbdbuser@localhost")
          df = pd.read_csv("data/got_cast.csv")
          df.to_sql("got_cast", schema="w4111_f22_hw4", con=engine, index=False, if_exists="replace")
          df = pd.read_csv("data/got_cast_details.csv")

	1	1	Winter Is Coming	/title/tt1480055/	2011-04-17	Jon Arryn, the Hand of the King, is dead. King Robert Baratheon plans to ask his oldest friend, Eddard Stark, to take Jon's place. Across the sea, Viserys Targaryen plans to wed his sister to a nomadic warlord in exchange for an army.		
	1	2	The Kingsroad	/title/tt1668746/	2011-04-24	While Bran recovers from his fall, Ned takes only his daughters to King's Landing. Jon Snow goes with his uncle Benjen to The Wall. Tyrion joins them.		
	1	3	Lord Snow	/title/tt1829962/	2011-05-01	Lord Stark and his daughters arrive at King's Landing to discover the intrigues of the king's realm.		
	1	4	Cripples, Bastards, and Broken Things	/title/tt1829963/	2011-05-08	Eddard investigates Jon Arryn's murder. Jon befriends Samwell Tarly, a coward who has come to join the Night's Watch.		
	1	5	The Wolf and the Lion	/title/tt1829964/	2011-05-15	Catelyn has captured Tyrion and plans to bring him to her sister, Lysa Arryn, at The Vale, to be tried for his, supposed, crimes against Bran. Robert plans to have Daenerys

l			w	4111_f22_hw4	
					killed, but Eddard refuses to be a part of it and quits.
1	6	A Golden Crown	/title/tt1837862/	2011-05-22	While recovering from his battle with Jaime, Eddard is forced to run the kingdom while Robert goes hunting. Tyrion demands a trial by combat for his freedom. Viserys is losing his patience with Drogo.
1	7	You Win or You Die	/title/tt1837863/	2011-05-29	Robert has been injured while hunting and is dying. Jon and the others finally take their vows to the Night's Watch. A man, sent by Robert, is captured for trying to poison Daenerys. Furious, Drogo vows to attack the Seven Kingdoms.
1	8 -	The Pointy End	/title/tt1837864/	2011-06-05	Eddard and his men are betrayed and captured by the Lannisters. When word reaches Robb, he plans to go to war to rescue them. The White Walkers attack The Wall. Tyrion returns to his father with some new friends.
1	9	Baelor	/title/tt1851398/	2011-06-12	Robb goes to war against the Lannisters. Jon finds himself struggling on deciding if his place is with Robb or the Night's Watch. Drogo has fallen ill from a fresh battle wound. Daenerys is desperate to save him.
1	10	Fire and Blood	/title/tt1851397/	2011-06-19	With Ned dead, Robb vows to get revenge on the Lannisters. Jon must officially decide if his place is with Robb or the Night's Watch. Daenerys says her final goodbye to Drogo.

Load Neo4j

- You are now going to load some information into Neo4j. Specifically, the Game of Thrones episodes, the Game of Thrones cast, and the Game of Thrones title-cast information.
- You can load the data into the notebook from the RDB using Pandas and SQLAlchemy.
- You will use py2neo to do the loading into Neo4j. The functions are later in the notebook.
- I decided to make this easier and give you some helper functions instead of having you figure it out by yourself.

Load SQL into DataFrames

```
In [40]:
          episodes_df = pd.read_sql("""
                       SELECT
                           seasonNum,
                           episodeNum,
                           episodeTitle,
                          substr(episodeLink, 8, length(episodeLink)-8) AS tconst,
                          episodeAirDate,

# Up until now, we have been directly using query languages to interact with databases.
# There are many higher layer language libraries that make using the databases "simpler."
# I avoided using these libraries because they obscure what is happening and hide the query language # Learning the query language(s) is important.
# # py2neo and other tools provide an "object-mapping" layers that maps between the data in the dat # and classes/objects in the programming language you are using. py2neo implements classes Node a #
from py2neo.data import Node, Relationship
In [45]:
graph = Graph(aura_url, auth=(aura_user, aura_pw))
```

• The following are a couple of helper functions that will simplify the homework.

```
In [46]:
          # The matcher classes simplify using the query language from withon Python and classes.
          from py2neo.matching import *
In [47]:
          def get_nodes(label, template):
              :param label: The label of the node
              :template: A dictionary of property, value pairs to match.
              :return: A list of matching nodes.
              nodes = NodeMatcher(graph)
              the_match = nodes.match(label, **template)
              result = []
              for n in the match:
                  result.append(n)
              return result
In [48]:
          keanu = get_nodes("Person", { "name": "Keanu Reeves" })
In [49]:
```

keanu

Out[49]:

[Node('Person', born=1964, name='Keanu Reeves')]

```
In [50]:
          def create_node(n):
              :template: A py2neo Node
              :return: None
              tx = graph.begin()
              tx.create(n)
              graph.commit(tx)
In [51]:
           # Create an GOT Actor node.
          sb = Node('GOT Actor', name="Sean Bean", nconst="nm0000293", born=1959)
